Ht.No : 2303A51434

Course name:AI Assisted coding

Bt no: 21

---

## Task 1: Cleaning Sensor Date

❖ Scenario:

❖ You are cleaning IoT sensor data where negative values are invalid.

❖ Task:

Use Gemini in Colab to generate a function that filters out all negative numbers from a list.

❖ Expected Output:

➤ Before/after list

➤ Screenshot of Colab execution

## Output:

---

Here's a function that takes a list of numbers and returns a new list containing only the non-negative numbers.

```
▶ def filter_negative_numbers(numbers):
    """
    Filters out negative numbers from a list.

    Args:
        numbers (list): A list of integers or floats.

    Returns:
        list: A new list containing only the non-negative numbers.
    """
    return [num for num in numbers if num >= 0]
```

The screenshot shows a code editor interface with a dark theme. On the left, there's a sidebar with icons for file operations like Open, Save, and Find. The main area has two tabs: [1] and [2]. Tab [1] contains a Python function named `filter\_negative\_numbers`:

```

def filter_negative_numbers(numbers):
    """
    Filters out negative numbers from a list.

    Args:
        numbers (list): A list of integers or floats.

    Returns:
        list: A new list containing only the non-negative numbers.
    """
    return [num for num in numbers if num >= 0]

```

Below the function, a note says "You can test the function with an example list like this:" followed by a code block:

```

# Example usage:
my_list = [1, -2, 3, -4, 0, 5, -6]
filtered_list = filter_negative_numbers(my_list)
print("Original list: (my_list)")
print("Filtered list: (filtered_list)")

... Original list: [1, -2, 3, -4, 0, 5, -6]
Filtered list: [1, 3, 0, 5]

```

On the right side of the interface, there's a sidebar titled "Release notes" and "Gemini X". It shows a conversation with Gemini AI:

- G: generate a function that filters out all negative numbers from a list.
- G: Sure, I can help you with that! Here's a Python function to filter out all negative numbers from a list, along with an example of how to use it.

At the bottom right, there are buttons for "Accept & Run", "Accept", and "Cancel". The status bar at the bottom right shows "11:08 AM" and "Python 3".

## Task 2: String Character Analysis

### ❖ Scenario:

**You are building a text-analysis feature.**

### ❖ Task:

**Use Gemini to generate a Python function that counts vowels, consonants, and digits in a string.**

### ❖ Expected Output:

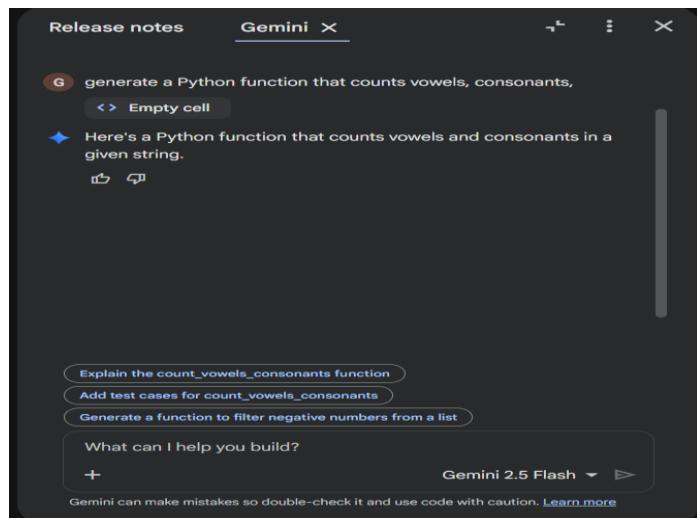

**➤ Working function**

**➤ Sample inputs and outputs**

---

## OUTPUT:

---

```
▶ def count_vowels_consonants(text):
    """
    Counts the number of vowels and consonants in a given string.

    Args:
        text (str): The input string.

    Returns:
        dict: A dictionary containing the counts of 'vowels' and 'consonants'.
    """
    vowels = "aeiouAEIOU"
    vowel_count = 0
    consonant_count = 0

    for char in text:
        if char.isalpha(): # Check if the character is an alphabet
            if char in vowels:
                vowel_count += 1
            else:
                consonant_count += 1

    return {"vowels": vowel_count, "consonants": consonant_count}
```

```
▶ # Example usage:  
my_string = "Hello World"  
counts = count_vowels_consonants(my_string)  
print(f"Original string: '{my_string}'")  
print(f"Vowels: {counts['vowels']}")  
print(f"Consonants: {counts['consonants']}")  
  
my_string_2 = "Python Programming"  
counts_2 = count_vowels_consonants(my_string_2)  
print(f"\nOriginal string: '{my_string_2}'")  
print(f"Vowels: {counts_2['vowels']}")  
print(f"Consonants: {counts_2['consonants']}")  
  
... Original string: 'Hello World'  
Vowels: 3  
Consonants: 7  
  
Original string: 'Python Programming'  
Vowels: 4  
Consonants: 13
```

---

---

### Task 3: Palindrome Check – Tool Comparison

❖ Scenario:

You must decide which AI tool is clearer for string logic.

❖ Task:

Generate a palindrome-checking function using Gemini and Copilot, then compare the results.

❖ Expected Output:

➤ Side-by-side code comparison

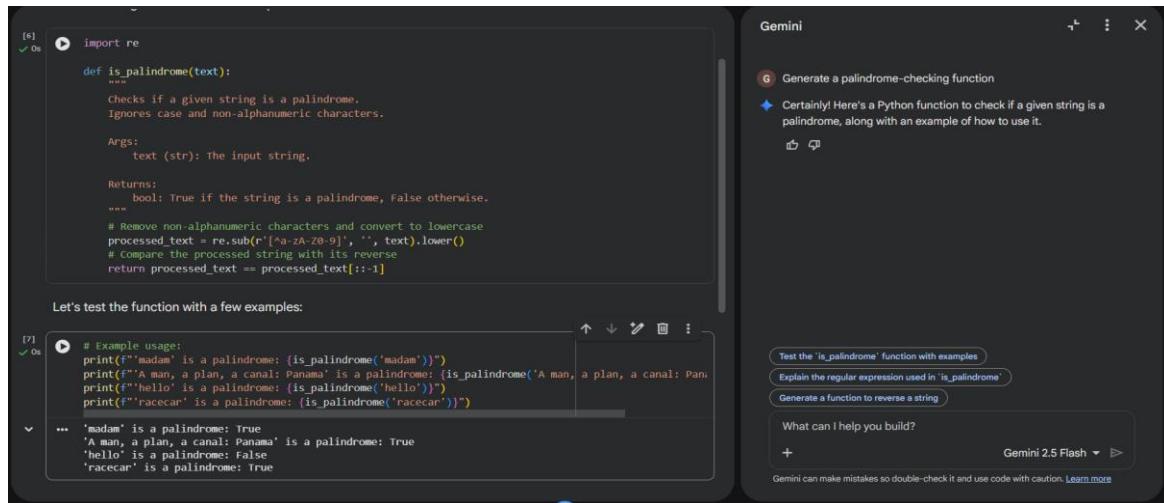

➤ Observations on clarity and structure

---

## Output :

---

### CODE GENERATED BY GEMINI:

The screenshot shows the Gemini AI interface. On the left, a code editor displays a Python function named `is_palindrome`. The function checks if a given string is a palindrome by removing non-alphanumeric characters, converting it to lowercase, and comparing it with its reverse. A test block below demonstrates the function with examples like 'madam', 'A man, a plan, a canal: Panama', and 'racecar'. On the right, the Gemini interface shows a summary of the task: generating a palindrome-checking function, followed by the generated code and a note that it's a Python function to check if a string is a palindrome.

```
import re

def is_palindrome(text):
    """
    Checks if a given string is a palindrome.
    Ignores case and non-alphanumeric characters.

    Args:
        text (str): The input string.

    Returns:
        bool: True if the string is a palindrome, False otherwise.

    """
    # Remove non-alphanumeric characters and convert to lowercase
    processed_text = re.sub(r'[^\w\-\_]', '', text).lower()
    # Compare the processed string with its reverse
    return processed_text == processed_text[::-1]

Let's test the function with a few examples:

# Example usage:
print("madam" is a palindrome: {is_palindrome('madam')})
print("A man, a plan, a canal: Panama" is a palindrome: {is_palindrome('A man, a plan, a canal: Panama')})
print("hello" is a palindrome: {is_palindrome('hello')})
print("racecar" is a palindrome: {is_palindrome('racecar')})
```

G | Generate a palindrome-checking function  
◆ Certainly! Here's a Python function to check if a given string is a palindrome, along with an example of how to use it.  
🔗 ↻

### CODE GENERATED BY COPILOT :

The screenshot shows the VS Code terminal window. It displays the same Python `is_palindrome` function as the Gemini interface. Below the function, two print statements are shown: one for the string 'A man a plan a canal Panama' which outputs 'True', and another for 'Hello' which outputs 'False'. The terminal also shows the path to the file: PS C:\Users\2303a\OneDrive\Documents\3rd Year\6th sem\AI Assistant coding> & 'c:\Users\2303a\vscode\extensions\ms-python.debugpy-2025.19.2026010901-win32-x64\c:\Users\2303a\OneDrive\Documents\3rd Year\6th sem\AI Assistant coding\new.py'

```
1 #Generate a palindrome check function
2 def is_palindrome(s):
3     # Remove spaces and convert to lowercase
4     s = s.replace(" ", "").lower()
5     # Check if the string is equal to its reverse
6     return s == s[::-1]
7 # Example usage
8 print(is_palindrome("A man a plan a canal Panama")) # Output: True
9 print(is_palindrome("Hello")) # Output: False
```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS GITLENS AZURE

True  
False

## **Observations on Clarity**

---

### **Gemini Code:**

- Very clear and well-documented.
- Includes a detailed docstring explaining the function's purpose, arguments, and return value.

### **Copilot Code:**

- Simple and easy to follow, especially for beginners.
  - Uses a short variable name `s`, which is functional but less descriptive.
  - Output is minimal—just True or False—with context.
- 

## **□ Observations on Structure**

---

### **Gemini Code:**

- Structured professionally with a reusable function and multiple test cases.
- Handles edge cases by removing non-alphanumeric characters and ignoring case.

### **Copilot Code:**

- Structurally simple and compact.
  - Focuses only on removing spaces and converting to lowercase.
-

## **Summary**

- **Gemini's version** is more comprehensive, polished, and ready for broader use.
  - **Copilot's version** is concise and beginner-friendly, great for learning or quick testing.
- 
- 

## **Task 4: Code Explanation Using AI**

❖ **Scenario:**

**You are reviewing unfamiliar code written by another developer.**

❖ **Task:**

**Ask Gemini to explain a Python function (prime check OR palindrome check) line by line.**

❖ **Expected Output:**

- **Code snippet**
  - **AI explanation**
  - **Student comments on understanding**
- 

**OUTPUT :**

---

The screenshot shows a Jupyter Notebook cell (labeled [6]) containing Python code for a palindrome checker, followed by a test section. To the right is the Gemini AI interface, which generated the code and provided documentation and examples.

```

[6] import re
def is_palindrome(text):
    """
    Checks if a given string is a palindrome.
    Ignores case and non-alphanumeric characters.

    Args:
        text (str): The input string.

    Returns:
        bool: True if the string is a palindrome, False otherwise.
    """
    # Remove non-alphanumeric characters and convert to lowercase
    processed_text = re.sub(r'[^a-zA-Z0-9]', '', text).lower()
    # Compare the processed string with its reverse
    return processed_text == processed_text[::-1]

Let's test the function with a few examples:

```

```

[7] # Example usage:
print("madam" is a palindrome: {is_palindrome('madam')}")
print("A man, a plan, a canal: Panama" is a palindrome: {is_palindrome('A man, a plan, a canal: Panama')})
print("hello" is a palindrome: {is_palindrome('hello')}")
print("racecar" is a palindrome: {is_palindrome('racecar')})"

```

**Gemini**

Generate a palindrome-checking function

Certainly! Here's a Python function to check if a given string is a palindrome, along with an example of how to use it.

Test the `is_palindrome` function with examples  
Explain the regular expression used in `'is_palindrome'`  
Generate a function to reverse a string

What can I help you build?

+ Gemini 2.5 Flash ➤

Gemini can make mistakes so double-check it and use code with caution. [Learn more](#)

## AI Explanation :

**G Explain the code line by line**

Certainly! Let's break down the palindrome-checking code line by line.

**Cell b252d9a5 : The `is_palindrome` function**

```

import re

```

This line imports the `re` module, which provides regular expression operations. It's used here to remove non-alphanumeric characters from the input string.

```

def is_palindrome(text):
    """
    Checks if a given string is a palindrome.
    Ignores case and non-alphanumeric characters.

    Args:
        text (str): The input string.

    Returns:
        bool: True if the string is a palindrome, False otherwise.
    """

```

This is a docstring that explains what the `is_palindrome` function does, its arguments (Args), and what it returns (Returns). It specifies that the function checks for palindromes, ignoring case and non-alphanumeric characters.

```

# Remove non-alphanumeric characters and convert to lowercase
processed_text = re.sub(r'[^a-zA-Z0-9]', '', text).lower()

```

This is the core processing step:

- `re.sub(r'[^a-zA-Z0-9]', '', text)`: This uses a regular expression to find all characters in the `text` string that are *not* alphanumeric (i.e., not a letter from 'a' to 'z' or 'A' to 'Z', or a digit from '0' to '9') and replaces them with an empty string, effectively removing them.
- `.lower()`: After removing non-alphanumeric characters, this converts the entire resulting string to lowercase. This ensures that the palindrome check is case-insensitive (e.g., 'Racecar' becomes 'racecar'). The result is stored in the `processed_text` variable.

```

# Compare the processed string with its reverse
return processed_text == processed_text[::-1]

```

This line checks if `processed_text` is equal to its reverse:

- `processed_text[::-1]`: This is a Python slice operation that creates a reversed copy of the `processed_text` string.
- `==`: This operator compares the `processed_text` with its reversed version. If they are identical, the string is a palindrome, and the expression evaluates to `True`; otherwise, it's `False`. This boolean result is then returned by the function.

**Cell e1b3b2d9 : Example Usage**

```
# Example usage:  
This is a comment indicating that the following lines demonstrate how to use the is_palindrome function.  
print(f"'madam' is a palindrome: {is_palindrome('madam')}'")  
This line calls is_palindrome with the string 'madam'. The result (True) is then embedded into an f-string and printed to the console.  
print(f"'A man, a plan, a canal: Panama' is a palindrome: {is_palindrome('A man, a plan, a canal: Panama')}")  
This line calls is_palindrome with a classic palindrome phrase. The function will first process this string to 'amanaplanacanalpanama' (removing spaces, punctuation, and converting to lowercase) before checking if it's a palindrome. The result (True) is printed.  
print(f"'hello' is a palindrome: {is_palindrome('hello')}")  
This line calls is_palindrome with 'hello'. Since 'hello' is not the same as 'olleh', it will return False, which is then printed.  
print(f"'racecar' is a palindrome: {is_palindrome('racecar')}")  
This line calls is_palindrome with 'racecar'. Since 'racecar' is the same as its reverse, it will return True, which is then printed.  
These example calls demonstrate how the function handles different inputs, including simple words, phrases with punctuation and mixed casing, and both palindromic and non-palindromic strings.
```

---

---

## Clear Understanding:

- ***"The explanation was very clear. I now understand how regular expressions are used to clean the string."***
- ***"I get why .lower() is important — it makes the check case-insensitive."***
- ***"The slicing trick [::-1] for reversing a string is neat, I hadn't seen that before."***
- ***"The examples helped me see how the function works with both simple words and complex phrases."***
